2. Explore the Hugging Face library and load a pre-trained transformer model.

**Aim:**

To explore the Hugging Face Transformers library and load a pre-trained transformer model.

**Algorithm:**

Start the program.
Import `AutoTokenizer` and `AutoModel` from the Transformers library.
Specify the pre-trained model name as `bert-base-uncased`.
Load the tokenizer associated with the model.
Load the pre-trained BERT model from Hugging Face.
Display the model name and model type.
Display the hidden size and number of transformer layers.
Verify that the model is loaded successfully.
Stop the program.

**Code:**

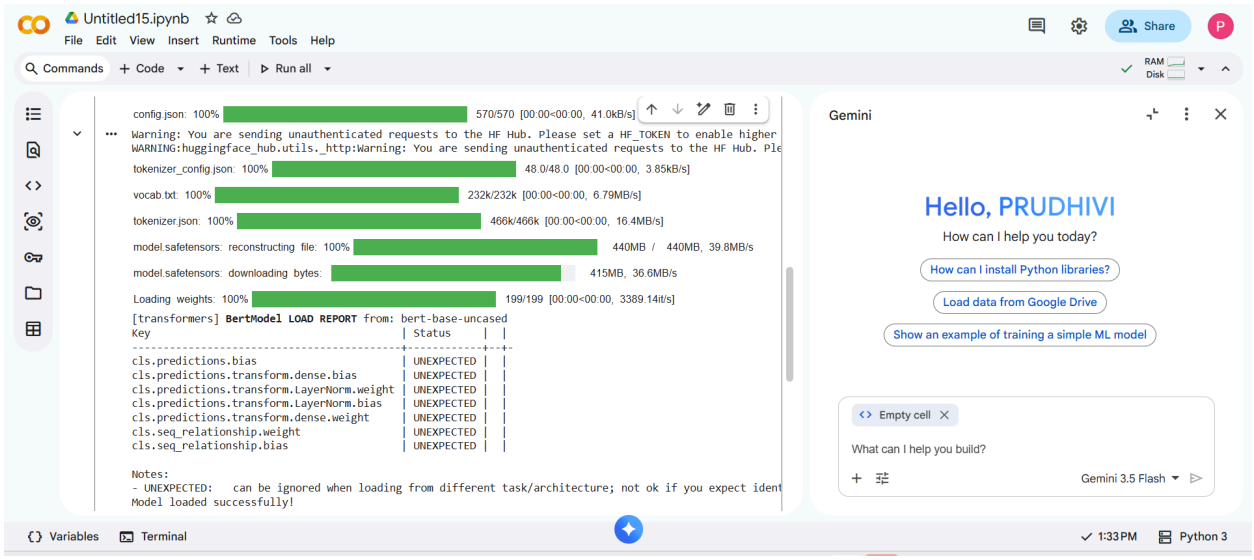

```
from transformers import AutoTokenizer, AutoModel

model_name = "bert-base-uncased"

# Load the tokenizer and pre-trained model
tokenizer = AutoTokenizer.from_pretrained(model_name)
model = AutoModel.from_pretrained(model_name)

print("Model loaded successfully!")
print("Model name:", model_name)
print("Model type:", model.config.model_type)
print("Hidden size:", model.config.hidden_size)
print("Number of layers:", model.config.num_hidden_layers)
```

**Screenshot:**

**Result:**

The pre-trained BERT model and its tokenizer were loaded successfully.
